3D-P Partners with Redline Communications for its Backhaul and Distribution Solutions

Calgary – October 14, 2016 - 3D-P, a leading provider of wireless connectivity solutions for the mining industry, announced today a partnership with Redline Communications to supply its backhaul and distribution networking equipment.

3D-P recognizes the unique challenges that mining wireless communication presents and continuously reviews alternate solutions to provide the best possible technology options for its customers to address those challenges.

3D-P's new partnership with Redline Communications provides ruggedized, high-performing, and easy-to-use backhaul equipment that supplements the performance and reliability of the 3D-P designed wireless networks. Redline products include a full suite of high performance Point-to-Point, Point-to-Multipoint and LTE solutions. Just one of the exciting differentiators from Redline is the RDL3000 RAS Elite. The RAS provides an integrated multi-sector antenna that will self-align 360 degrees to the best uplink radio. Deploying a RAS on a semi-mobile asset such as a solar powered repeater trailer means that after relocating the trailer, no human intervention is needed to align the PMP radio to the tower. The self-aligning antenna takes care of itself, providing the strongest link possible at the new location.

“We are very excited with the renewed partnership with Redline and look forward to leveraging Redline’s substantial capabilities and deployment capabilities to allow 3D-P’s clients to gain even greater value from their wireless networks.”, says David Fisk Vice President of Sales and Marketing at 3D-P.

In this age of cost reduction and productivity improvement, mine personnel continue to spend a significant amount of their time physically maintaining the mine’s wireless environment for optimal communications. 3D-P’s partnership with Redline provides technology solutions that enable a significant reduction in this time, allowing miners to focus on key information, not the network transporting it.

About 3D-P

3D-P (www.3d-p.com) offers wireless connectivity solutions to make the Internet of Things (IoT) a reality for mining. Through a complete range of wireless connectivity solutions, 3D-P ensures high performance of your wireless network and real-time access to your critical production and asset health data, while 3D-P's Intelligent Endpoint (IEP) product line provides powerful edge computing, for optimal management of your operations every day.

About Redline

Redline Communications (www.rdlcom.com) is the creator of powerful wide-area wireless networks for the most challenging applications and locations. Used by oil and gas companies to manage their assets, militaries for secure battlefield communications, municipalities to remotely monitor highways, utilities and other infrastructures, and telecom service providers to deliver premium services, Redline's powerful and versatile networks reliably and securely deliver voice, data, M2M and video communications for mission-critical applications.
