

3D-P announces release of 110715 firmware

Calgary, Alberta - October 15, 2011

3D-P, a leading provider of technology products for the mining industry, is pleased to announce the latest firmware release for the Intelligent Endpoint product line.

Developed specifically for mining and heavy industrial use, Intelligent Endpoints are robust, open, networking and computing platforms that provide seamless connectivity, even with on-machine applications not designed for modern networks. Intelligent Endpoints are based on open standards and are designed to integrate seamlessly with multiple systems including, dispatch systems, machine health systems, high-precision GPS, slope monitoring, dewatering, video cameras, safety and security systems, etc. Intelligent Endpoints provide a common platform that can be used to provide connectivity to new systems and old, providing uninterrupted, reliable computing and communications for all of your mine technology assets.

The 110715 firmware release prepares the Intelligent Endpoints to work with the companies recently released Endpoint Manager version 1.3. Firmware version 110715 for the e30, e55, e56, e57, and e58 products includes EPMonboard. EPMonboard is a web GUI tool that allows configuration of the basic networking functions of the Intelligent Endpoint in an intuitive and easy to use web page.

Intelligent Endpoints with a serial number beginning 110111 will have firmware version 110715 included from the factory. An upgrade file is available that can be used to upgrade existing units in the field to this latest release. The upgrade is available to all 3D-P customers who are covered by a current 3D-P Support Agreement.
